On May 10, 2003 this sequence version replaced gi:24819649.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Submitted (29-JUN-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 250425)
Rat Genome Sequencing Consortium.
                                                may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Direct Submission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Worley, K.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

NOTE: This is a "working draft" sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the
                                                                                                                                                                                                                                                                                                    Submitted (28-SEP-2002) Human Genome Sequencing Center, Depa of Molecular and Human Genetics, Baylor College of Medicine, Baylor Plaza, Houston, TX 77030, USA

COMMENT

ANNOTATION OF FEATURES: STSs are identified using ePCR (Genome Res. 7:541-550) searches

Features listing.

of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST

(Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the State Lorentzities by Burden. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the State and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL:

http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html. Location/Qualifiers

submitted (13-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On May 13, 2003 this sequence version replaced gi:24819215.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projecte/rat/). Bach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hernandez, R., Hines, S., Hladdun, S.L., Hodgson, A., Hogles, M.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On May 10, 2003 this sequence version replaced gi:24819573.
On May 10, 2003 this sequence version replaced gi:24819573.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Submitted (24-OCT-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 245476) 3 (bases 1 college Consortium.

Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Nov 20, 2002 this sequence version replaced gi:23914484.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Submitted (18-APR-2002) Human Genome Sequencing Center, Depay of Molecular and Human Genetics, Baylor College of Medicine, Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 189541)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Direct Submission

NOTE: Estimated insert size may differ from sequence length

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_data.html).

NOTE: This is a "working draft' sequence. It currently

consists of 52 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as

runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (09-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On May 9, 2003 this sequence version replaced gi:24818567.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Bach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (15-SBP-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rat Genome Sequencing Consortium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

                                                                                                                                                                                                                                                                                                NOTE: This record contains 70 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows
                                                                                                                                                                                                                                                                overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will

SAG genes, and mutant SAG genes, can be used to protect cells from apportosis induced by redox reagents. Antisense SAG genes can be used to inhibit the growth of tumour cells. The SAG genes can also be used for the recombinant production of the SAG proteins. The SAG proteins can be used to scaverage oxygen radicals in organisms and to promote wound healing. Additionally, the SAG genes or their complements can be used to promote or inhibit the growth of plant cells (all claimed). The SAG protein is also an ideal molecular target in the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The cDNA was isolated using differential display to identify genes associated with 1,10-phenanthroline (OP)-induced apoptosis in murine tumour lines, and use of an isolated OP-inducible clone to screen a mouse lung cDNA library. The mouse SAG cDNA was used to identify human SAG (see AAX87314). SAG is highly conserved among species. Disruption in yeast was shown to be lethal. SAG deletion mutants (see AAX87315-16) have been identified in human cancer lines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the nucleotide sequence of mouse sensitive to apoptosis (SAG) cDNA, which codes for a novel redox-sensitive, haem-binding protein (see AAY06491) with a zinc RING finger domain that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products activity, tumour inhibition activity or other activities.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human secreted proteins, and encode the proteins given in AAY0160 AAY11994 to AAY12260, respectively. The proteins given represent signal peptide and an N-terminal fragment of a secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX40826 to AAX41093 represent 5' expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in AAY01602
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acids encoding human secreted proteins - obtained from cDNA libraries prepared from kidney, fetal kidney, dystrophic muscle, muscle and heart tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Duclert A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-AUG-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 342 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful for diagnostic and therapeutic purposes, preferably for diagnosing and treating tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes a human ROC2 ring finger protein. The specification also describes human ROC1. ROC1 and ROC2 are similar to APC11, a subunit of the APC complex. The proteins stimulate cullin dependent ubiquitin ligase activity. ROC1 functions in vivo as an essential regulator of CDK inhibitor Sic1 degradation by the SCF (undefined) pathway. ROC proteins are useful for screening bioactive agents that interfere with the binding of ROC proteins with cullin proteins. Pharmaceutical formulations comprising ROC proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid encoding cullin regulating ring finger proteins, termed as ROC proteins similar to anaphase-promoting complex 11, for therapeutic and diagnostic use

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAH43568-72 encode proteins which may be used in the method of the invention for assaying ubiquitin ligase activity. The method comprises combining under conditions that favour ubiquitin collagse activity, tag1-ubiquitin, El (ubiquitin activating enzyme), E2 (ubiquitin conjugating enzyme) and E3 (ubiquitin ligase) and measuring the amount of tag1-ubiquitin bound to the E3. The method is useful for assaying ubiquitin ligase activity and ubiquitination enzyme activity assaying ubiquitin the amount of tag1-ubiquitin, the modulator, E1 and tag2-E3 and measuring the amount of tag1-ubiquitin bound to tag2-E3 and activity is measuring the amount of tag1-ubiquitin bound to tag2-E3 or combining tag1-ubiquitin bound to tag2-E3 are an activity is measured to tag1-ubiquitin bound to tag2-E3. Ubiquitin ligase activity is measured collectly, eliminating the need for target proteins and subsequent canalysis such as separating ligated from unligated material in an SDS-PAGE procedure. This allows multi-well array analysis and high combinations of E3 components and E2/E3 combinations without requiring combinations of E3 components and E2/E3 combinations without requiring combinations of E3 components and E2/E3 combinations without requiring combinations of identification of specific target substrates. Ubiquitin is labeled, directly or indirectly and this allows for easy and rapid detection and component of ligated ubiquitin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The method is particularly used to screen for modulators of UL activity. The present sequence is human RING finger protein, ROC2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Assay for ubiquitin ligase activity, useful for identifying modulators, by measuring binding of labeled ubiquitin to ubiquitin ligase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     P-PSDB; AAE24621.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                               This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM1, which codes for a SAG protein (see AAY06495) (and which the Cys residue at position 50 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 50 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is at a haem binding site of SAG. Single and Cdouble SAG mutants (see AAX87317-31) were made in order to determine 30 cluble sad mutants (see AAX87317-31) were made in order to determine 60 cligomerization. MM1 showed reduced haem binding but unaffected 61 coligomerization. SAG is a novel zinc finger protein that promotes 61 growth, protects cells from apoptosis, scavenges oxygen 62 cradicals and can be used for the reversion of a tumour phenotype. 62 cradicals and can be used for the reversion of a tumour phenotype. 63 creembinant production of SAG genes, and mutant SAG genes, can be used to protect cells from 62 cradicals induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets 62 in the development of drugs against neurodegenerative disorders, 62 cancers and muscle dystrophy, and promoting wound healing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oligomerization. These properties were unaffected by the MM5 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM5, which codes for a SAG protein (see AAY06499) in which the Cys residue at position 80 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 80 from TGC to AGC obtained by site-directed mutagenesis of SAG cDNA. This residue is in zinc-ring finger 1 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG constraints.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM6, which codes for a SAG protein (see AAY06500) in which the His residue at position 82 of the native protein (see AAY06492) is replaced by a Lys residue owing to a mutation of codon 82 from CAT to AAA obtained by site-directed mutagenesis of SAG cDNA. This residue is in zinc-ring finger 1 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM6 mutation. SAG is a novel zinc finger protein that promotes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM7, which codes for a SAG protein (see AAY06501) or in which the His residue at position 85 of the native protein (see AAY06492) is replaced by a Lys residue owing to a mutation of codon 85 from CAC to AAG obtained by site-directed mutagenesis of SAG CDNA. This residue is in zinc-ring finger 2 of SAG. Single and Cd double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG CO cligomerization. These properties were unaffected by the MM7 call growth, protects cells from apoptosis, scavenges oxygen cradicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the reversion of a tumour phenotype. Cracombinant production of SAG genes, which are molecular targets in the development of drugs against neurodegenerative disorders, or cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM8, which codes for a SAG protein (see AAY06502) (CC (SAG) mutant gene MM8, which codes for a SAG protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon CC (SAG) and the second by a Ser residue owing to a mutation of codon CC (SAG). This residue is in zinc-ring finger 2 of SAG. Single and CC (SUAL). This residue is in zinc-ring finger 2 of SAG. Single and CC (SUAL) are see AAX67317-31) were made in order to determine CC (SAG) and the see AAX67317-31) were made in order to determine CC (SAG) genesization. These properties were unaffected by the MM8 (SCC) (SAG) genes, and mutant SAG genes, can be used to protect cells from apoptosis, scavenges oxygen CC (SAG) genes, and mutant SAG genes, can be used to protect cells from CC (SAG) genes, and mutant SAG genes, can be used to protect cells from CC (SAG) genes, made to protect cells from CC (SAG) genes, can be used to protect cells from CC (SAG) genes, made to protect cells from CC (SAG) genes, can also be used for the cerombinant production of SAG proteins, which are molecular targets CC in the development of drugs against neurodegenerative disorders, and mutant of drugs against neurodegenerative disorders, can care and mutant of drugs against neurodegenerative disorders, and mutant cale dvetronhy and normartive during head in the development of drugs against neurodegenerative disorders, and mutant sage to the protein of the development of drugs against neurodegenerative disorders, and mutant sage adaptor and neurone head in or careers and mutant sage and mutant sage and mutant sage and mutant sage and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

These properties were unaffected by the MM9 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                   CDS
                                                                                                                                                                                                                   mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM9, which codes for a SAG protein (see AAY06503) in which the Cys residue at position 99 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 99 from TGC to AGC obtained by site-directed mutagenesis of SAG cDNA. This residue is in zinc-ring finger 2 of SAG. Single and double SAG mutants (see AAX87317-31) were made in order to determine

These properties were unaffected by the MM10 mutations. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM10, which codes for a SAG protein (see AAY06504) in which the His residues at positions 82 and 85 of the native protein (see AAY06492) are replaced by Lys residues owing to mutations of codons 82 and 85 by site-directed mutagenesis of SAG CDNA. These residues are in zinc-ring fingers 1 and 2 of SAG. SAG mutants (see AAX87317-31) were made in order to determine the role of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cDNA. This residue is in zinc-ring finger 1 of SAG. Single and double SAG mutants (see AAX67317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM11 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 15; Page 76; 84pp; English.

This residue is in a protease inhibitor motif of SAG. Single and double SAG mutants (see AAX87317-31) were made to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM12 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from appottosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from appottosis induced by redox reagents. They can also be used for the recombinant production of SAG proteins, which are molecular targets in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of human sensitive to apoptosis (SAG) mutant gene MM12, which codes for a SAG protein (see AAY06506) in which the Cys residue at position 73 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 73 from TGT to AGC obtained by site-directed mutagenesis of SAG 73 from TGT to AGC obtained by site-directed mutagenesis of SAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SAG: Sensitive to Apoptosis Gene and related proteins, useful promoting cell growth and protecting cells against apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11-SEP-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (SAG) mutant gene MM14, which codes for a SAG protein (see AAY06508)

(in which the Cys residues at positions 99 and 102 of the native protein (see AAY06492) are replaced by Ser residues owing to mutations of codons 99 and 102 through site-directed mutagenesis of SAG cDNA. These residues are in zinc ring finger 2 of SAG. Single double SAG mutants (see AAX87317-31) were made in order to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization was observed, indicating that these residues are important for intermolecular disulfide bond formation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis, which are molecular targets in the development of durings against neurodegenerative disorders, cancers and muscle
                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (SAG) mutant gene MM15, which codes for a SAG protein (see AAY06509) in which the Cys residue at position 47 of the native protein (see AAY06509) in which the Cys residue at position 47 of the native protein (see AAY06492) is replaced by a Ser residue owing to a mutation of codon 47 from TGC to AGC obtained by site-directed mutagenesis of SAG CDNA. This residue is in a GADPH binding site of SAG. Single and double SAG mutants (see AAX87317-31) were made to determine the role of each cysteine residue of SAG in haem binding and SAG oligomerization. These properties were unaffected by the MM15 mutation. SAG is a novel zinc finger protein that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype. SAG genes, and mutant SAG genes, can be used to protect cells from apoptosis induced by redox reagents. They can also be used for the reversion of a tumour phenotype in the development of drugs against neurodegenerative disorders, cancers and muscle dystrophy, and promoting wound healing.
